I have a Lenovo G770 laptop, windows 8 pro, 8 GB ram, used both wired and wireless connection to internet, disabled my Webroot Secure Anytime antivirus and disabled the windows firewall. Nothing lets me in. I added this site to my trusted sites and still nothing.

I tried to update the program and I was told it was unavailable and to try again later. Did that and it repeated the same message.

This is strange. I get the message about refreshing the page and usually can get in but never on your site. Do you have any ideas at all?
